APPLICATION SPECIFICATION FOR USE OF
NAP-GARD® HIGH TEMP TWO PART EPOXY
SPRAY GARDE

STEEL SUBSTRATE

Revised: May 26, 2017

1.0 SYSTEM: NAP-GARD® 7-1854

2.0 GENERAL

2.1 NAP-GARD® 7-1854 Spray Grade is a 100% solids, two-part epoxy designed for high temperature service in the oil and gas industry.

2.2 This specification covers only the spray application of the material. For brush or roller application, refer to the NAP-GARD® 7-1854 Brush Grade Application Specification. Only application to steel surfaces is intended.

2.3 Mixing Ratio: 3 Parts Base to 1 Part Hardener (pre-measured) by volume.

2.4 Mixed Color: Gold.

3.0 SURFACE PREPARATION

3.1 All surfaces to be coated shall be abrasive blasted to SSPC SP-10 (Near White) cleanliness or equivalent. The resulting surface roughness profile shall be a minimum of 62.5 microns (2.5 mils) and a maximum of 125 microns (5.0 mils) peak to valley.

3.2 The underside and narrow edges of all angles, weld beads, pits and structural members must be blasted to the same surface condition as specified in Section 3.1. All surfaces must be cleaned of all blasting products, leaving no trapped particles or traces when blasting is completed.

3.3 All surfaces to be coated must be completely dry, free of moisture, soil, dust and abrasive material at the time the coating is applied. All weld spatters must be removed from the surface and rough welds must be ground smooth prior to coating.

3.4 Only that area that can be coated in a particular day shall be blast-cleaned and should extend for at least 50 mm (2") past the end. Any area that is allowed to sit overnight must be returned to its original blast-cleaned condition. This requirement also applies to any blast-cleaned surface that has flash rusted as a result of exposure to rain or moisture.

3.5 If the coating operation is to continue to the following day, the edges of the area coated with NAP-GARD® 7-1854 Spray Grade are to be feathered down to the steel substrate after the coating has cured and before resumption of coating.

3.6 All blasting onto existing NAP-GARD® 7-1854 Spray Grade must be directed from the coated surface to the adjacent substrate rather than from the substrate onto the coating. The blasting should be initiated 300 mm (12") onto the coating.

3.7 Grit blasting must be directed from the parent coating to the adjacent substrate rather than from the substrate onto the coating when coating girth welds where the parent coating is Fusion Bond Epoxy (FBE) or Polyethylene.

Always consult product Material Safety Data Sheet (SDS) prior to handling.

WARRANTY POLICY: Axalta Powder Coating Systems USA, Inc. (“Seller”) certifies that all coatings delivered to Customer in unopened factory filled containers meet all pertinent quality standards presented in Seller’s current published literature. Since matters of surface preparation, application procedures, curing procedures and other local factors that affect coating performance are beyond Seller’s control; Seller assumes no liability for coating failure other than to supply replacement material for coating material proven to be defective. Customer will determine suitability of this product for use and thereby assumes all risks and liabilities in connection therewith. Seller will not be liable for any injuries, damages or other losses derived, directly or indirectly, from or as a consequence of Customer’s use of the product. SELLER DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, RELATING TO ITS PRODUCTS AND THEIR APPLICATION, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY AND FITNESS FOR PARTICULAR PURPOSES.
Always consult product Material Safety Data Sheet (SDS) prior to handling.

3.8 Prior to coating, all areas, including the floor, scaffolding, walkways and decks within 15 m (50’) of the coating site, shall be swept or cleaned of abrasive products to prevent wind blown contamination of the coating surface.

3.9 Wetting of the ground in the vicinity of the coating operation may be necessary on new construction sites with bare ground and where high winds may occur.

4.0 APPLICATION

4.1 NAP-GARD® 7-1854 Spray Grade can be applied directly to the prepared surface without the need for additional priming systems. Increased film thickness may be required in certain immersed applications operating at elevated temperatures. Contact Axalta’s technical department for additional information.

4.2 NAP-GARD® 7-1854 Spray Grade must be applied to clean, dry surfaces only. Condensation, precipitation, water vapor or any other forms of contamination will be NOT be acceptable on the blasted surface prior to coating. Surfaces subject to any of these conditions shall be cleaned with fresh water if necessary and re-blasted to return the surface to SSPC SP-10 Cleanliness as per Section 3.

4.3 The acceptable substrate temperature range for application of NAP-GARD® 7-1854 Spray Grade is 10°C (50°F) to 100°C (212°F). The substrate temperature must be a minimum of 3°C (5°F) above the dew point temperature before proceeding with the coating operation.

4.4 Coating application can be performed in cold temperature conditions if the substrate is preheated. For some applications, post-heating may be required to achieve an adequate cure depending upon ambient temperature, pipe wall thickness, and other variables. The coating must not be allowed to freeze before an adequate cure is reached. Preheating and post-heating may also be utilized if an accelerated cure time is required.

4.5 Preheating may be accomplished by either flame heating the surface with a propane torch prior to blasting or by the use of an induction coil or catalytic infra-red heater subsequent to blasting and prior to coating. Post-heating can only be done using an induction coil or catalytic infrared heater.

4.6 The appropriate preheat temperature and cure time can be determined from the attached NAP-GARD® 7-1854 Spray & Brush Grade Curing Table. The maximum preheat temperature shall not exceed 100°C (212°F)

4.7 NAP-GARD® 7-1854 Spray Grade shall be applied to the specified Dry Film Thickness (DFT) in a single application using Graco Hydra-Cat high pressure airless spray equipment or approved equal. Wet Film Thickness (WFT) measurements should be continuously taken to ensure the minimum film thickness specified. In general, a WFT of 0.50 mm (20.0 mils) can be applied in a single application. If additional coats are required, they shall be applied while the preceding coat is still tacky. The maximum over-coating interval shall not exceed four (4) hours at 25°C (77°F) without roughening the surface.

4.8 NAP-GARD® 7-1854 can be over-coated without the need for an additional tie coat. Should the over-coating interval exceed four (4) hours, the surface should be blast roughened prior to application of the topcoat.

4.9 Scaffolding and items such as hoses, cable braces, etc. shall be a minimum of 457 mm (18") from the surface to be coated or placed so as not to interfere with the space normally required for a spray gun operation.

4.10 A minimum of four (4) hours curing above 25°C (77°F) is required prior to handling. Handling time may be longer at lower temperatures.

5.0 APPEARANCE OF FINISHED COATING
5.1 The finished coating shall be generally smooth and free of protuberances or holidays. All surfaces shall have the required minimum DFT. In general, the surface of the coating shall be no rougher than the base or substrate material.

5.2 The applicator shall exercise every reasonable precaution to assure proper application of the coating and satisfactory protection of the steel surface.

6.0 **INSPECTION**

6.1 The owner’s appointed representative must inspect the quality of the blasted surfaces, including cleaning of abrasive from these surfaces prior to the application of NAP-GARD® 7-1854 Spray Grade. Acceptance to be given by said representative to the owner and contractor’s representative.

6.2 WFT measurements should be continuously taken to ensure the minimum film thickness specified. WFT measurements should be taken using Axalta approved WFT gauges.

6.3 After the NAP-GARD® 7-1854 Spray Grade has cured to a tack-free condition, the owner’s representative and / or contractor’s inspector should measure the DFT with an Axalta approved, calibrated, magnetic gauge and / or electronic DFT gauge. The appointed inspector shall notify the applicator of their acceptance. Notification to the applicator of all inadequately coated sections must be made immediately.

6.4 Spark testing of the finished coating film may be performed to ensure adequate corrosion protection. The maximum voltage used for this testing shall not exceed 100 volts per mil (25 microns). Reference is to be made to NACE RP0274-93.

6.5 Immediately upon completion of the work, the coating application shall be subject to final inspection by the owner’s representative. Notification of all defects must be made within a reasonable time frame from completion of the work to allow for all repairs within the allowed time frame for the project.

6.6 For the initial spray application, a minimum of one plate sample coated to the specified DFT and one free film sample sprayed to a minimum DFT of 4.0 mm (100 mils) shall be taken. The plate size should be approximately 100 mm x 150 mm x 9.5 mm (4.0” x 6.0” x 0.375”). The plate must be cleaned in accordance with Section 3. Both samples should be cured for a minimum of four (4) days at 20˚C (68˚F) prior to testing.

6.6.1 **Adhesion Test:** Apply three (3) tensile adhesion dollyies to the plate sample with epoxy adhesive and cure for 24 hours at 20˚C (68˚F). Pull the dollyies at a controlled rate with an elcometer adhesion tester or equal at approximately 25 mm (1 inch) per minute. The minimum average adhesion should be 2000 PSI.

6.6.2 **Hardness Test:** Test the Shore D Hardness of the free film sample. Hardness should be Shore D 80-88.

6.7 **Fast Cure Test:** In the case of pipeline valves, header assemblies, hot bends and other fabricated sections requiring immediate shipment to the field from the coating mill; the following procedure should be used to properly determine the quality:

6.7.1 Force cure both plate and free film samples at 100˚C (212˚F) for one (1) hour.
6.7.2 Cool samples to 20˚C (68˚F).
6.7.3 Test the Shore D Hardness of the free film sample. Hardness should be Shore D 80-88.
6.7.4 Apply thumb to the surface of the free film sample. No thumbprint should be left in the coating.
6.7.5 Conduct a “cross hatch” adhesion test on the plate sample as follows:

6.7.5.1 Using a sharp pointed knife, make two 13 mm long scribes through to the metal surface to form a V with an angle of approximately 30˚ at the intersection point.
6.7.5.2 Starting at the point of intersection, force the coating from the steel substrate using a sharp pointed knife. Care should be taken to protect the eyes and hands when carrying out this operation.
6.7.5.3 **Rating:** Shear adhesion shall be rated from 1 to 4 as follows:

6.7.5.3.1 The coating cannot be removed cleanly from the surface and exhibits substantial resistance to cohesive failure.
WARRANTY POLICY:

Axalta Powder Coating Systems USA, Inc. (“Seller”) certifies that all coatings delivered to Customer in unopened factory filled containers meet all pertinent quality standards presented in Seller’s current published literature. Since matters of surface preparation, application procedures, curing procedures and other local factors that affect coating performance are beyond Seller’s control; Seller assumes no liability for coating failure other than to supply replacement material for coating material proven to be defective. Customer will determine suitability of this product for its use and thereby assumes all risks and liabilities in connection therewith. Seller will not be liable for any injuries, damages or other losses derived, directly or indirectly, from or as a consequence of Customer’s use of the product.

Seller disclaims all other warranties, express or implied, relating to its products and their application, including but not limited to warranties of merchantability and fitness for particular purposes.

Always consult product Material Safety Data Sheet (SDS) prior to handling.

SELLER DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, RELATING TO ITS PRODUCTS AND THEIR APPLICATION, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY AND FITNESS FOR PARTICULAR PURPOSES.

6.7.5.3.2 The extent of adhesive failure between the coating and the substrate shall not exceed 4 mm from the center point of the cross. The coating exhibits substantial resistance to cohesive failure.

6.7.5.3.3 The extent of adhesive failure between the coating and the substrate exceeds 4 mm from the center point of the cross and/or the coating exhibits poor cohesive strength and can easily be delaminated.

6.7.5.3.4 The coating exhibits little or no adhesion and peels off in large pieces.

Note: A minimum rating of 2 is required to pass the shear adhesion test.

7.0 REPAIRS

7.1 Repair of pinholes and holidays 300 mm (12”) or less in diameter may be accomplished by using NAP-GARD® 7-1854 Cartridges. Refer to NAP-GARD® 7-1854 for Use of NAP-GARD® 7-1854 Cartridge for Coating Repairs. The procedure is as follows:

7.1.1 Repair areas should be roughened using carborundum cloth, sandpaper, file, or surface grinder.
7.1.2 The adjacent coating should be abraded for a minimum distance of 25 mm (1”) to ensure inter-coat adhesion.
7.1.3 If necessary on larger repairs, feather the edges of the adjacent coating.
7.1.4 Wipe with a clean cloth to remove dust. A dust respirator should be worn for all sanding or grinding activities.
7.1.5 All surfaces to be coated shall be clean and completely dry prior to the application of the coating.
7.1.6 The minimum surface temperature for coating is 10°C (50°F). The substrate temperature must be a minimum of 3°C (5°F) above the dew point temperature.
7.1.7 The area to be coated should be preheated in cold temperature conditions. The appropriate preheat temperature and cure time can be determined from the attached NAP-GARD® 7-1854 Curing Table. The maximum preheat temperature shall not exceed 100°C (212°F). For some applications, post-heating may be required to achieve an adequate cure depending upon ambient temperature, pipe wall thickness, and other variables. The coating must not be allowed to freeze before an adequate cure is reached. Preheating and post-heating may also be utilized if an accelerated cure time is required.
7.1.8 Preheating may be accomplished by either flame heating the surface with a propane torch prior to blasting or by the use of an induction coil or catalytic infrared heater subsequent to blasting and prior to coating. Post-heating can only be done using an induction coil or catalytic infrared heater.
7.1.9 Eject the required amount of material from the cartridge onto a clean tray using the manual dispenser.
7.1.10 Hand-mix the product with a stir stick until the coating color becomes uniform with no streaks.
7.1.11 Apply the coating to the required thickness on the area to be repaired using a spatula or paintbrush.
7.1.12 Extend the coating to at least 25 mm (1”) over the surrounding pre-roughened coating.

7.2 Areas larger than 300 mm (12”) in diameter shall be repaired using NAP-GARD® 7-1854 Brush Grade kits. Refer to NAP-GARD® 7-1854 Brush Grade Application Specification. The procedure is as follows:

7.2.1 Areas requiring repair shall be prepared with a surface grinder or by abrasive blasting. All edges of the surrounding area shall be feathered. A dust respirator should be worn for all grinding activities.
7.2.2 The surface to be coated shall be completely clean and dry prior to applying the coating.
7.2.3 The minimum surface temperature for coating is 10°C (50°F). The substrate temperature must be a minimum of 3°C (5°F) above the dew point temperature.
7.2.4 The area to be coated should be preheated in cold temperature conditions. The appropriate preheat temperature and cure time can be determined from the attached NAP-GARD® 7-1854 Spray and Brush Grade Curing Table. The maximum preheat temperature shall not exceed 100°C (212°F). For some applications, post-heating may be required to achieve an adequate cure depending upon ambient temperature, pipe wall thickness, and other variables. The coating must not be allowed to freeze before an adequate cure is reached. Preheating and post-heating may also be utilized if an accelerated cure time is required.
7.2.5 Preheating may be accomplished by either flame heating the surface with a propane torch prior to blasting or by the use of an induction coil or catalytic infrared heater subsequent to blasting and prior to coating. Post-heating can only be done using an induction coil or catalytic infrared heater.
Always consult product Material Safety Data Sheet (SDS) prior to handling.

WARRANTY POLICY: Axalta Powder Coating Systems USA, Inc. ("Seller") certifies that all coatings delivered to Customer in unopened factory filled containers meet all pertinent quality standards presented in Seller's current published literature. Since matters of surface preparation, application procedures, curing procedures and other local factors that affect coating performance are beyond Seller's control; Seller assumes no liability for coating failure other than to supply replacement material for coating material proven to be defective. Customer will determine suitability of this product for its use and thereby assumes all risks and liabilities in connection therewith. Seller will not be liable for any injuries, damages or other losses derived, directly or indirectly, from or as a consequence of Customer's use of the product. SELLER DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, RELATING TO ITS PRODUCTS AND THEIR APPLICATION, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY AND FITNESS FOR PARTICULAR PURPOSES.

7.2.6 Coat the repair area in accordance with Section 7.0 of the NAP-GARD® 7-1854 Brush Grade Application Specification.

7.3 Uncured areas requiring re-coating shall first have all uncured material removed and shall have the surface re-cleaned in accordance with Section II taking care to feather the edges of the surrounding coating. Re-application of the coating shall be in accordance with Sections 4.0, 5.0 and 6.0.

8.0 SAFETY PRECAUTIONS

8.1 The contractor will provide accessible, safe and secure work areas

8.2 Other contract services will be halted as necessary so as not to interfere with the work flow of the NAP-GARD® 7-1854 Spray Grade application.

8.3 NAP-GARD® 7-1854 Spray Grade is HARMFUL IF ABSORBED THROUGH SKIN, INHALED OR SWALLOWED. It is a skin and eye irritant. Personal protective equipment is required. Refer to the Material Safety Data Sheets.

8.3.1 Chemical resistant gloves with a long cuff that will overlap the clothing sleeves should be worn when handling this product. The glove / clothing overlaps should be sealed by tape. Check with the glove manufacturer to determine the proper glove type.

8.3.2 Wear an appropriate, properly fitted vapor respirator (NIOSH / OSHA approved) during application where vapor / mist are likely to be encountered, e.g. confined spaces and during winter construction or when the substrate is preheated. For outdoor application and areas with adequate ventilation, the use of a respirator is normally not required. Follow the respirator manufacturer’s recommendations. A dust respirator should be used for any activity such as sanding or grinding of cured coating.

8.3.3 Wear splash proof chemical safety goggles and / or face shield.

8.3.4 Wear impervious boots.

8.3.5 Long-sleeved clothing is to be worn over regular clothing to cover all exposed areas of arms, legs or torso during mixing and application of the coating. Breathable clothing, such as cotton or disposable coveralls, is recommended.

8.3.6 Emergency eyewash and a shower should be in close proximity, where possible. A barrier cream may be used, in conjunction with the stated protective measures, as an additional safeguard against skin contact

8.4 Keep the containers closed when not in use. In case of spillage, absorb with inert material and dispose of in accordance with Federal, Provincial, and Municipal regulations in Canada and Federal, State, and County regulations in the United States of America.

8.5 No open flames, smoking or welding will be allowed in the immediate vicinity during the application of NAP-GARD® 7-1854 Spray Grade.

8.6 All personnel on the application crew shall be informed of regulations regarding smoking, auto traffic restrictions, the meaning of warning bells, horns and whistles, fire warnings and restricted areas. Members of the coating crew shall maintain good personal hygiene, wash thoroughly after exposure to the coating application, particularly before eating or going on breaks.

9.0 EQUIPMENT

9.1 Graco Hydra-Cat high pressure spray equipment or approved equal must be used to apply NAP-GARD® 7-1854 Spray Grade coating systems in accordance with Axalta's recommendations and specifications.

10.0 MATERIALS

10.1 NAP-GARD® 7-1854 Spray Grade containers must be sealed prior to use. Product exposed to the atmosphere must be protected with a blanket of nitrogen gas.
10.2 NO amount of 7-1854 Spray Grade shall be given, sold or exchanged without express written permission from Axalta.

10.3 The acceptable shipping and storage temperature range for NAP-GARD® 7-1854 Spray Grade is between 5°C (41°F) to 40°C (104°F).

10.4 Store NAP-GARD® 7-1854 Spray Grade in a cool, dry, well-ventilated area. Keep the lids sealed. The Shelf Life is a maximum of 24 months in unopened containers.

11.0 SUBSTRATE TYPES

11.1 This specification is applicable to standard steels.

11.2 Exotic metals, stainless steel or other special types of steel or alloys may require different consideration as to surface preparation and product formulations. Notification of the use of such metals must be made to Axalta.
