AquaEC 3500 EP

AquaEC™ 3500 EP, Axalta's new generation of Cathodic Electrocoat provides a major step forward in edge corrosion protection, while building on the benefits of our renowned AquaEC™ 3000 series: it is tin free, contains no toxic heavy metals and it works at low curing temperature, just to mention a few. Customers benefit from a highly efficient system due to a low dry film density. Contact us to find out how AquaEC™ 3500 EP can meet your specific requirements. The product has been designed to be used in following segments: Automotive parts and accessories, Agricultural and Construction equipment, General Industry and Industrial Job Coaters.

AquaEC 3000

AquaEC 3000 is a tin-free family of epoxy-based primers that have been the electrocoat of choice for many European manufacturers of automotive parts and automotive accessories, electric housings, switch gear and computer components. It offers excellent mechanical properties, good chemical resistance and superior corrosion protection. AquaEC 3000 is particularly valuable when corrosion on parts with sharp edges is an issue.

AquaEC 5000

AquaEC 5000 is a family of single layer cathodic e-coat based on acrylic resins that are highly UV resistant. They have been specially developed to provide excellent coverage on the first run. Their long-term weathering resistance, mechanical properties and powerful corrosion protection make these e-coats ideally suited for bulk coating of outdoor equipment. As with all of Axalta's E-coats, AquaEC 5100, AquaEC 5500 and AquaEC 5700 are environmentally responsible and HAPs compliant due to their lead-free, water-based formulations.
